

This project has received funding from the European Union's Horizon2020 research and innovation programme under grant agreement N° 863819

FlexPlan

Advisory Board Meeting | 29<sup>th</sup> October 2020

# Pan-European and regional scenarios

Jawana Gabrielski, Nuno Amaro

# Agenda

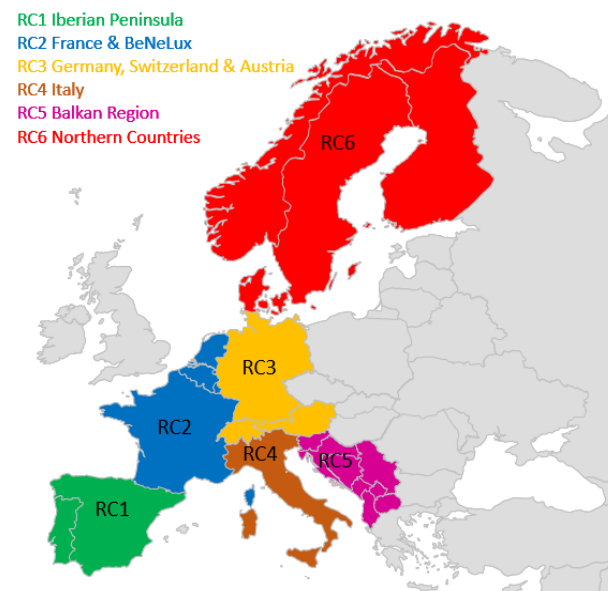

- Introduction
- Pan-European Scenarios
- MILES Regionalization Module
- Exemplary preliminary results (1 scenario)

# Introduction

FlexPlan aims to develop an innovative grid planning tool and validate it using six ambitious regional cases covering different geographies in Europe

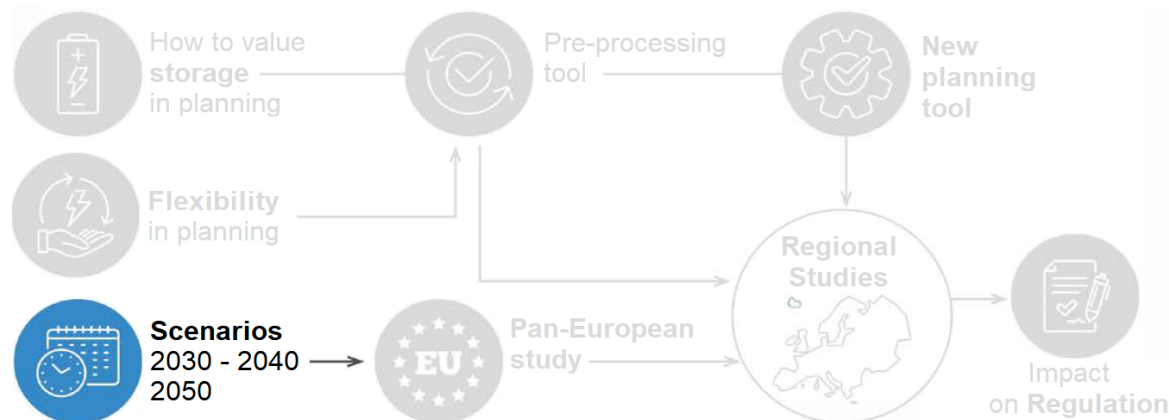

This results in a complete data collection and analysis process, including:

- **Pan-European Scenarios for the considered target years**
  - European based
  - Regionalization needed (up to grid node detail)
- Grid models
  - Transmission and distribution
  - Including geographic information
- Additional data sources for complementary studies
  - Environmental impact
  - Fuel and Technology costs (OPF)

# Pan-European Scenarios

- Three Scenarios
  - Pan-EU framework, data at national level
    - Installed generation capacities by technology
    - Annual mean capacity factors for renewable energy sources
    - Annual electricity consumption and peak load
    - Hourly time series data for consumption
    - Net transfer capacities
    - Commodity prices for different types of fuel for nuclear and fossil power station
    - Total operational reserve power
- Using already validated data sources, to foster work development and achieve a higher acceptance of developed tool and obtained results

- TYNDP 2020 Scenarios used as main data source
  - Complemented by TYNDP2018 and MAF2018, when needed
- Three target years
  - 2030
  - 2040
  - 2050
- But...
  - TYNDP 2020 does not detail data for 2050 (only presents trends at EU level)

### National Trends (NT)

is the central scenario based on draft NECPs in accordance with the governance of the energy union and climate action rules, as well as on further national policies and climate targets already stated by the EU member states. Following its fundamental principles, NT is compliant with the EU's 2030 Climate and Energy Framework (32 % renewables, 32.5 % energy efficiency) and EC 2050 Long-Term Strategy with an agreed climate target of 80–95 % CO<sub>2</sub> reduction compared to 1990 levels.

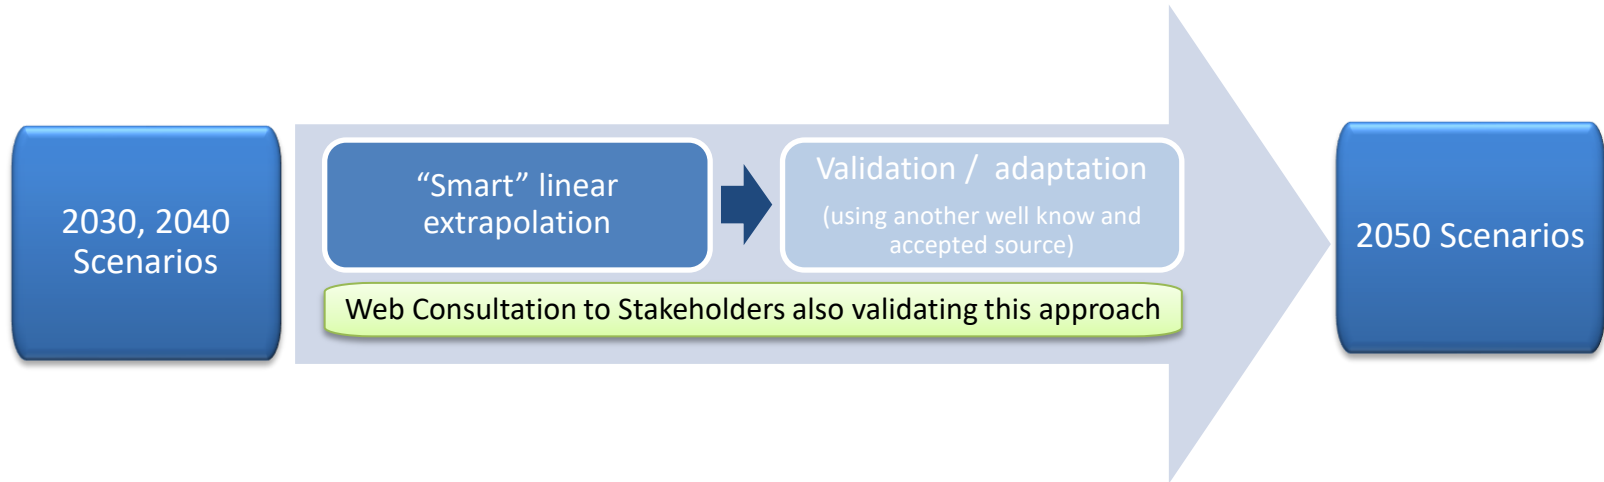

### Global Ambition (GA)

is a scenario compliant with the 1.5° C target of the Paris Agreement also considering the EU's climate targets for 2030. It looks at a future that is led by development in centralised generation. Economies of scale lead to significant cost reductions in emerging technologies such as offshore wind, but also imports of energy from competitive sources are considered as a viable option.

### Distributed Energy (DE)

is a scenario compliant with the 1.5° C target of the Paris Agreement also considering the EU's climate targets for 2030. It takes a de-centralised approach to the energy transition. A key feature of the scenario is the role of the energy consumer (prosumer), who actively participates in the energy market and helps to drive the system's decarbonisation by investing in small-scale solutions and circular approaches.

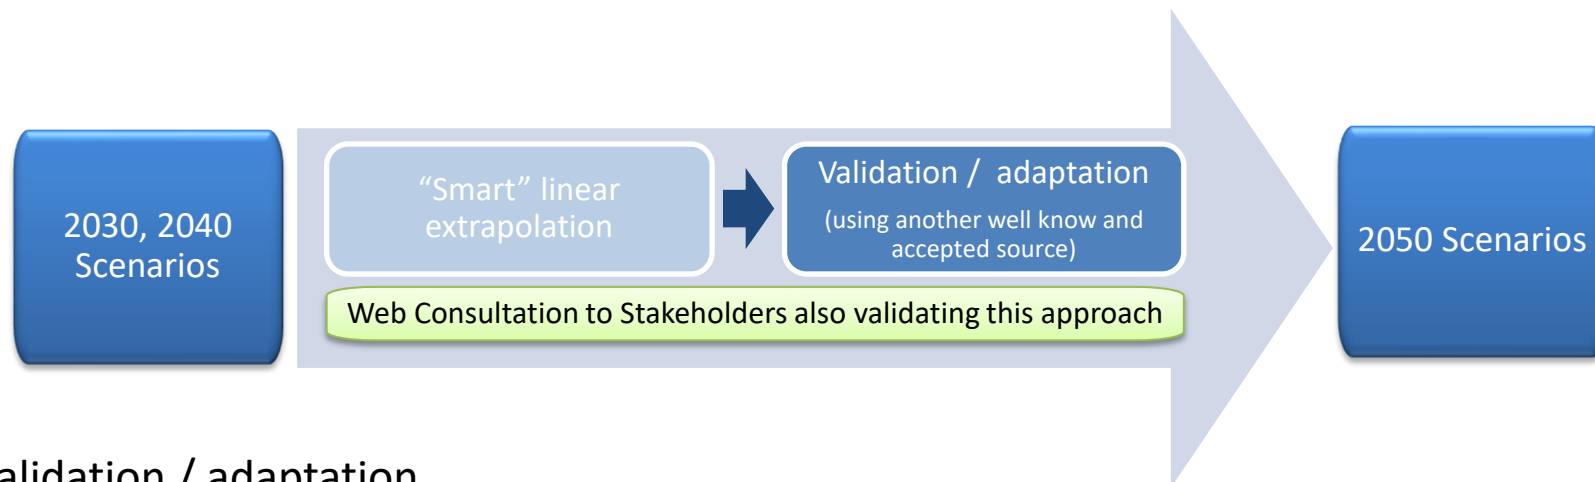

Source: ENTSO-E

### "Smart" linear extrapolation

- Respecting physical limits
  - No negative installed capacities (which might arise from reducing trend in some technologies)
  - Capacity factors for renewables are maintained
- Does not apply to reserve calculation

## Validation / adaptation

- Using «A Clean Planet for All» long term strategy from EU Commission
  - ELEC scenario for National Trends
  - 1.5 Tech and 1.5 Life scenarios for Global Ambition and Distributed Energy – approach already followed by ENTSO-E in TYNDP 2020 scenarios creation

## Some exemplary results – Evolution of installed capacity at EU level

National Trends

Distributed Energy

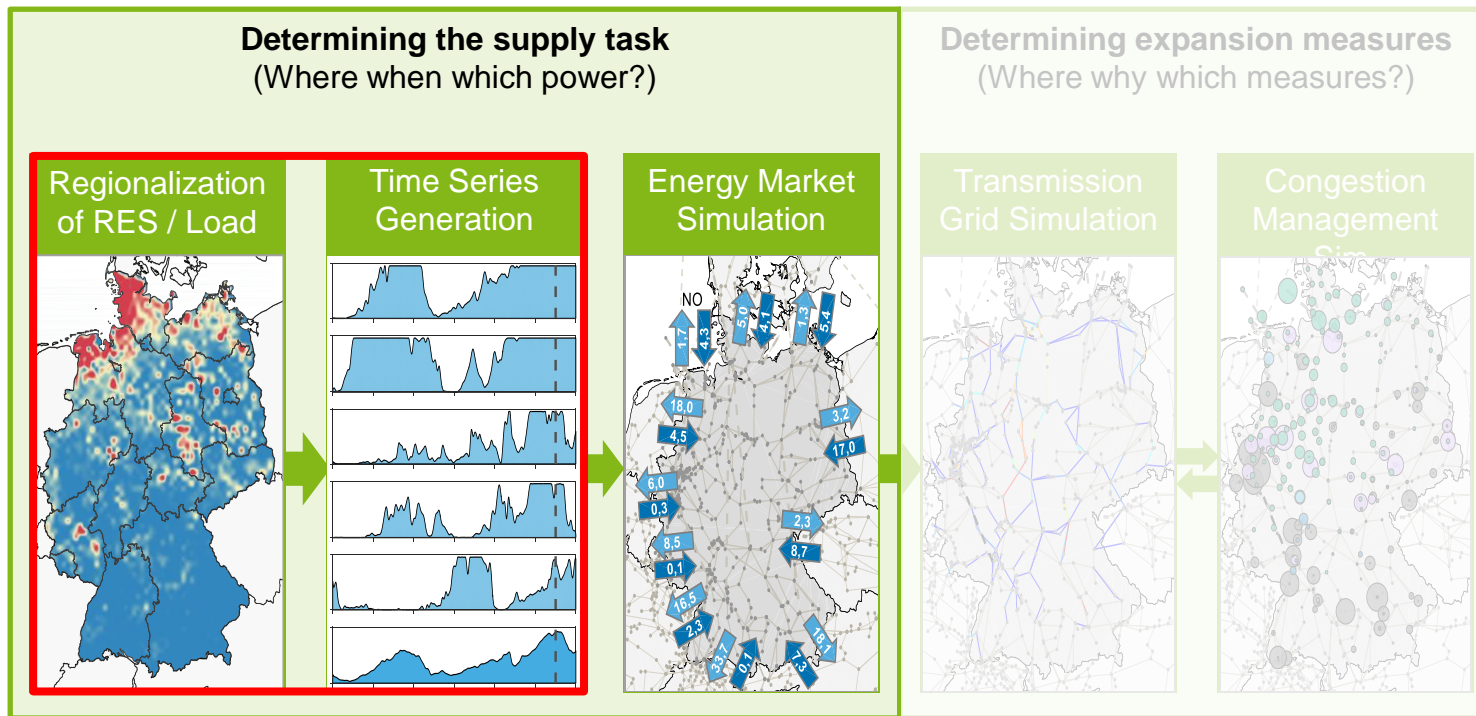

Global Ambition

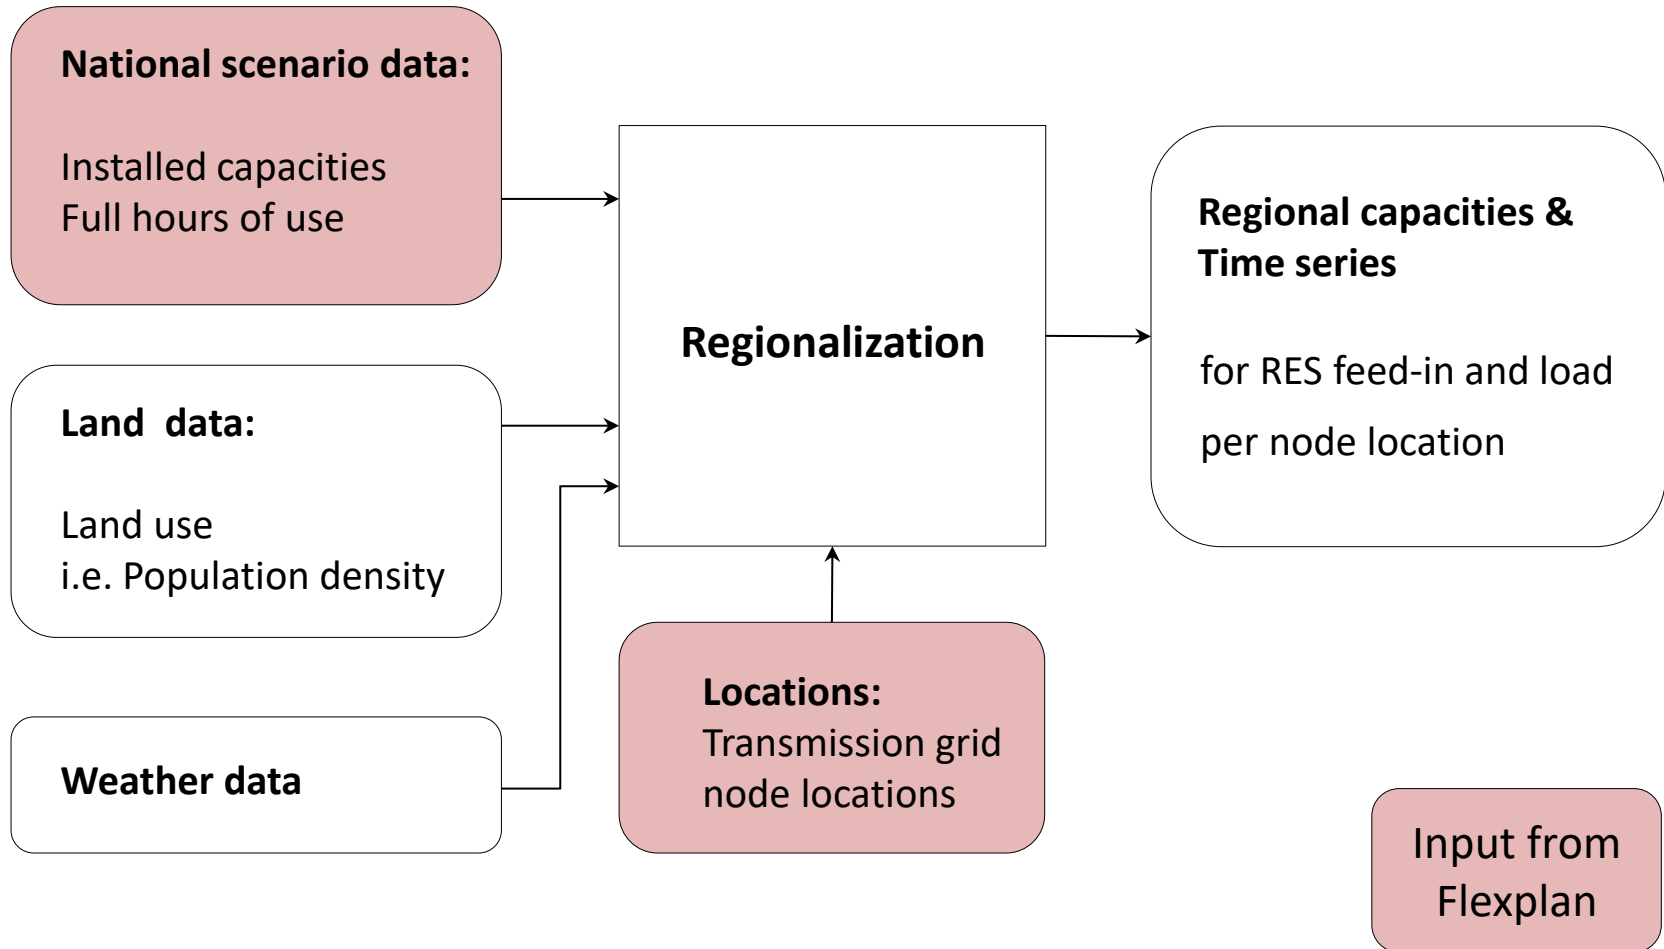

## Some exemplary results – country evolutions

Full methodological approach and additional results are available in Deliverable D4.1 –accessible at <https://flexplan-project.eu/publications/>

# Exemplary preliminary Results (1<sup>st</sup> Scenario)

# MILES first regionalization scenario results

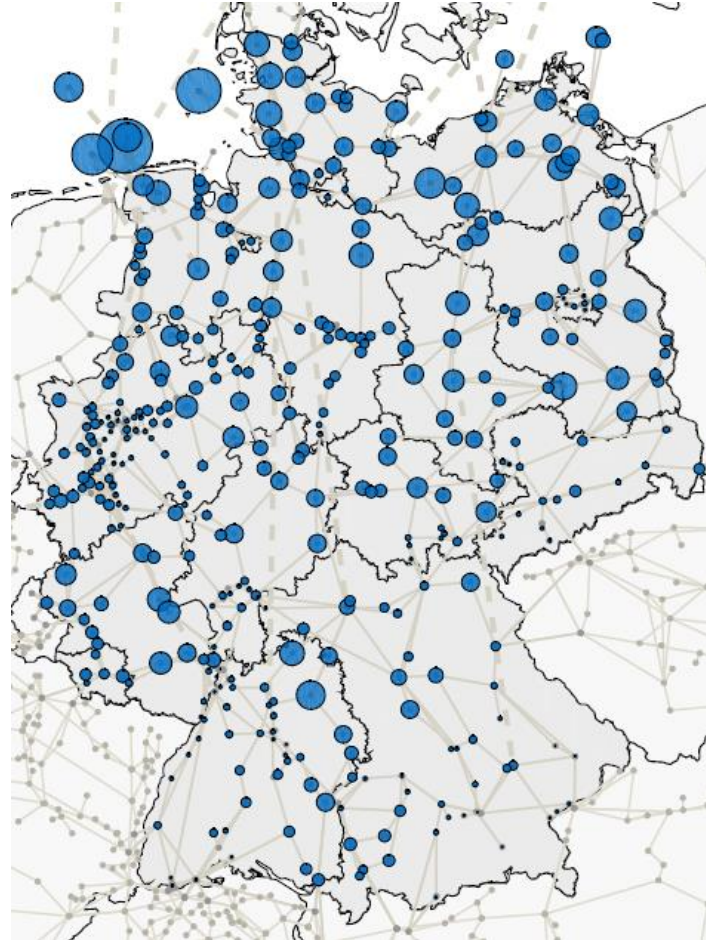

FlexPlan

Regional Case	Countries	Number of transmission nodes
1	Spain	599
	Portugal	404
2	France	766
	Netherlands	37
	Luxembourg	11
	Belgium	46
	Denmark	162
3	Norway	168
	Sweden	175
	Finland	70
	Italy	728
5	Serbia	79
	Macedonia	103
	Albania	165
	Montenegro	67
	Bosnien Herzegovina	240
	Croatia	233
	Slovenia	174
	Germany	732
	Austria	70
6	Switzerland	126

Spatially distributed PV capacities in Germany

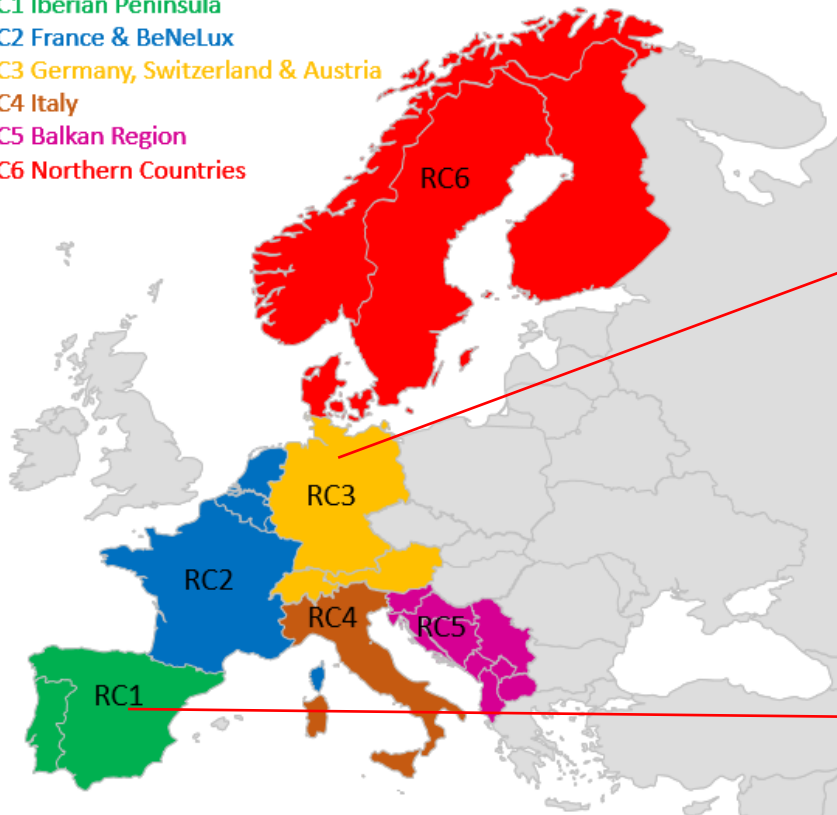

Spatially distributed wind capacities in Germany

# MILES first regionalization scenario results

FlexPlan

- RC1 Iberian Peninsula
- RC2 France & BeNeLux
- RC3 Germany, Switzerland & Austria
- RC4 Italy
- RC5 Balkan Region
- RC6 Northern Countries
